

# ClimateTales Rwanda and NDIM Engine

## Synthetic Narrative Corpus and Desk Review

Generated 2026-05-20 | Synthetic data for NDIM stress testing | Not field evidence

### Executive summary

The ClimateTales project asks whether culturally grounded narratives can improve clean climate technology adoption in Rwanda by linking social insight mining, behavioural design labs, a gamified influence simulator, and story activation pilots (AIMS-Imperial, 2025). This corpus translates that logic into importable NDIM test data.

### Thesis

Narrative evidence is necessary because household cooking choices are embedded in routine, status, gendered labour, food texture, trust in messengers, perceived risk, and community proof. Rwanda clean-cooking literature shows that adoption depends on affordability, supply, confidence, after-sales support, and social learning (Seguin et al., 2018; SNV, 2024).

### Antithesis

Narrative data can mislead if it is not governed. Stories can be duplicated, sensitive, biased, or manipulated. The corpus therefore includes consent, visibility, validation status, source actor, trusted messenger, and review fields.

### Synthesis

The NDIM pathway should turn narratives into governed evidence: intake, SDMX-style metadata, approval, encoding, simulation, inoculation testing, regional interpretation, and policy export.

### Limitations

These records are fictional and intended only for software and workflow stress testing. Real use requires consent, translation protocols, double coding, community validation, and human review.

### Dataset design

| Evidence route       | Rows | Purpose                                                                                        |
|----------------------|------|------------------------------------------------------------------------------------------------|
| structured_interview | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
| open_story           | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
| indigenous_knowledge | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
| citizen_science      | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
| crowd_batch          | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
| experimental_feed    | 10   | Stress-tests route-specific intake, metadata, governance, encoding, and policy interpretation. |
